

Frozen Gate A sensitivity grid: 72 five-seed configurations and 390 paired contrasts

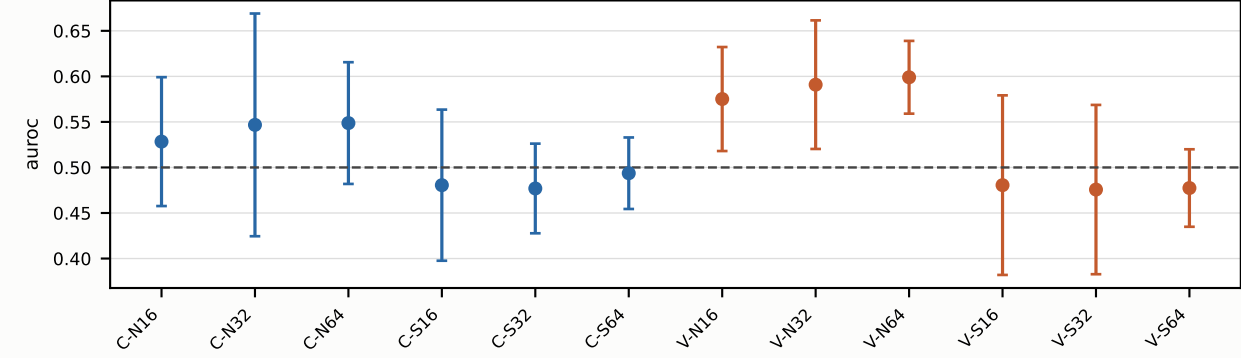

A CONCH: mean minus marker-specific null annotation: Δ null and chance-or-worse sampling seeds / 5

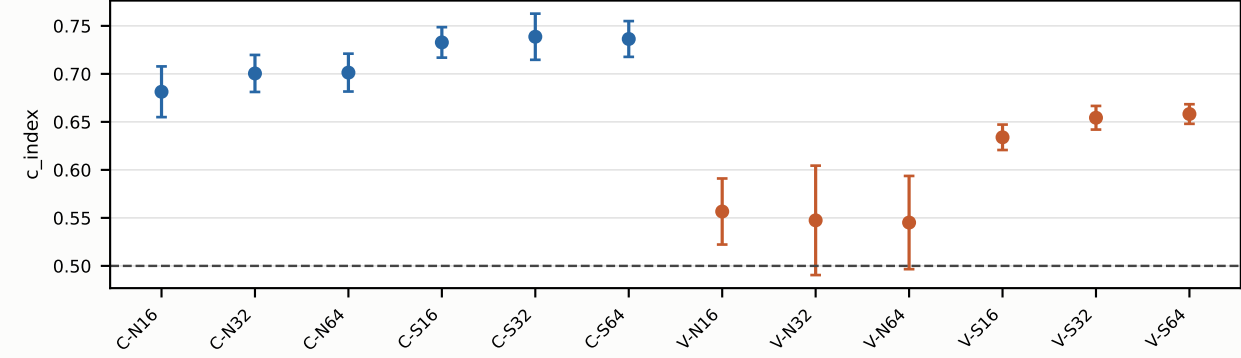

B Virchow: mean minus marker-specific null annotation: Δ null and chance-or-worse sampling seeds / 5

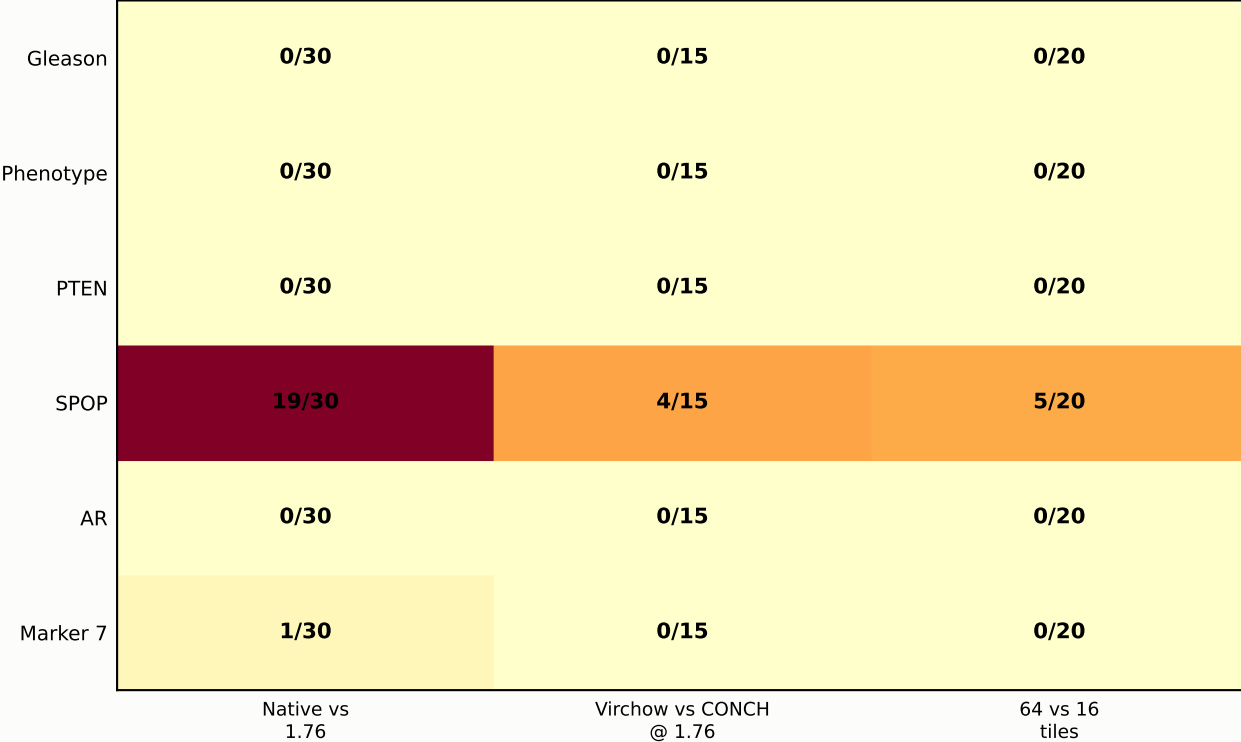

C SPOP — five-seed mean and sampling-seed t interval

Marker 7 — five-seed mean and sampling-seed t interval

D Null-crossing counts in paired contrasts

Heatmap magnitudes are interpreted within marker because metrics differ. Sampling-seed intervals describe five repeated tile-sampling seeds, not patient or population confidence intervals. Settings are correlated and share frozen cohorts and folds.
